Facilitates collaboration

Interacting with the Operating System

Shell: software layer to interact with the OS. Examples: bash, zsh, csh

CLI: Command Line Interface

```
ccruz@macpro:~  
> which git  
/opt/homebrew/bin/git  
> git --version  
git version 2.34.1  
~ |
```

The image shows a macOS Terminal window with a dark background. The title bar at the top reads 'ccruz@macpro:~'. The terminal content shows the execution of two commands: 'which git' which returns '/opt/homebrew/bin/git', and 'git --version' which returns 'git version 2.34.1'. A blue prompt character '~' is visible on the line following the second command. On the right side of the terminal window, there is a status bar showing a green checkmark, the word 'base', and a question mark in a box.

Terminal: Interface for Text commands

Interacting with the Operating System

Basic commands:

Directories

pwd : tells you where you currently are (the path)

mkdir dirname : create a new directory

cd dirname : change directory

Files

ls : list files

rm filename : remove a file

mv filename1 filename2 : rename a file

diff filename1 filename2 : compare two files

cat filename(s) : print file(s) contents

which : shows path of a command

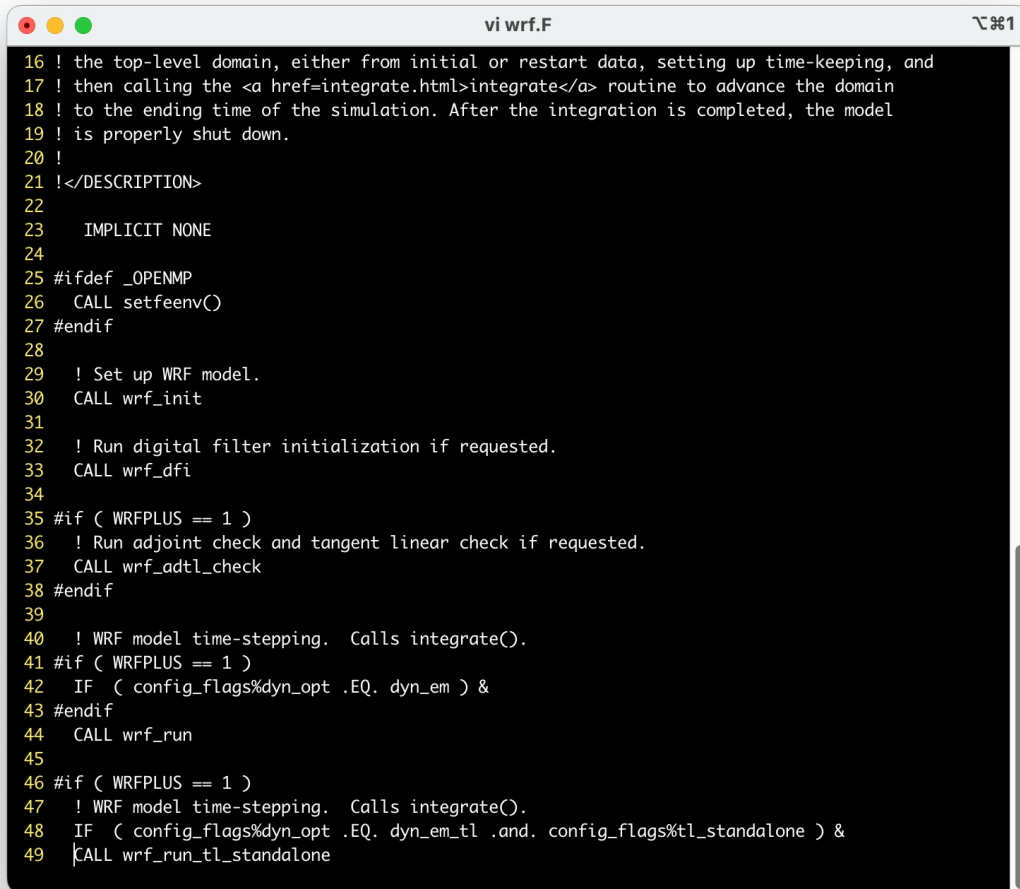

echo : write to standard output

A terminal window titled 'ccruz@macpro:~' with a dark background. It shows the execution of two commands: 'which git' which returns '/opt/homebrew/bin/git', and 'git --version' which returns 'git version 2.34.1'. Below the output, there is a blue prompt character '~' followed by a vertical bar. On the right side of the terminal, there is a blue button with a green checkmark and the text 'base' followed by a question mark icon.

```
> which git
/opt/homebrew/bin/git
> git --version
git version 2.34.1
~ |
```

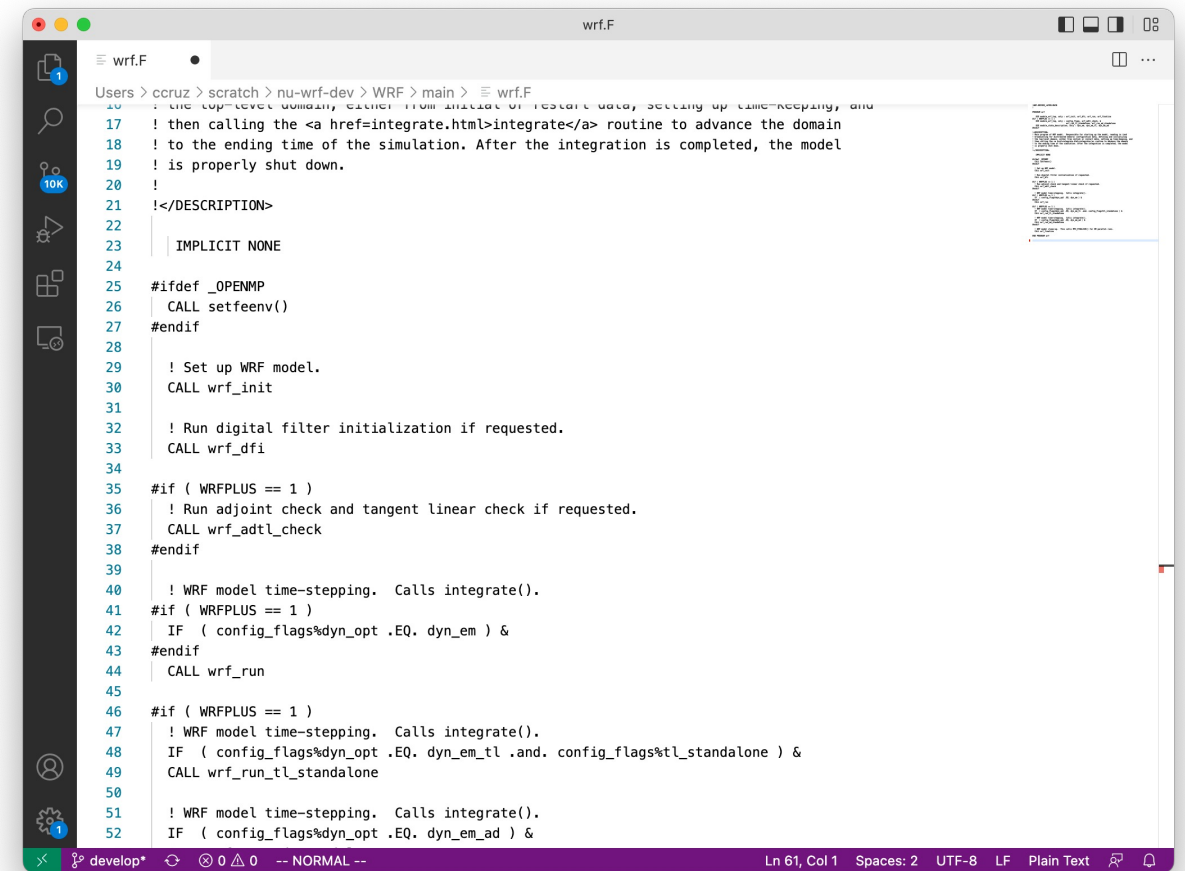

Creating and modifying files

Code Editor: **vim**, emacs, nano, IDEs,...

```

Working with Git

Git Customization

- **System:** /etc/gitconfig
- **User:** \$HOME/.gitconfig
- **Project:** my_project/.git/config

Git commands to edit configuration:

```
git config --system (system)
git config --global (user)
git config (project)
```

\$ git config --global user.name "[name]"

Sets the name you want attached to your commit transactions

\$ git config --global user.email "[email address]"

Sets the email you want attached to your commit transactions

\$ git config --global color.ui auto

Enables helpful colorization of command line output

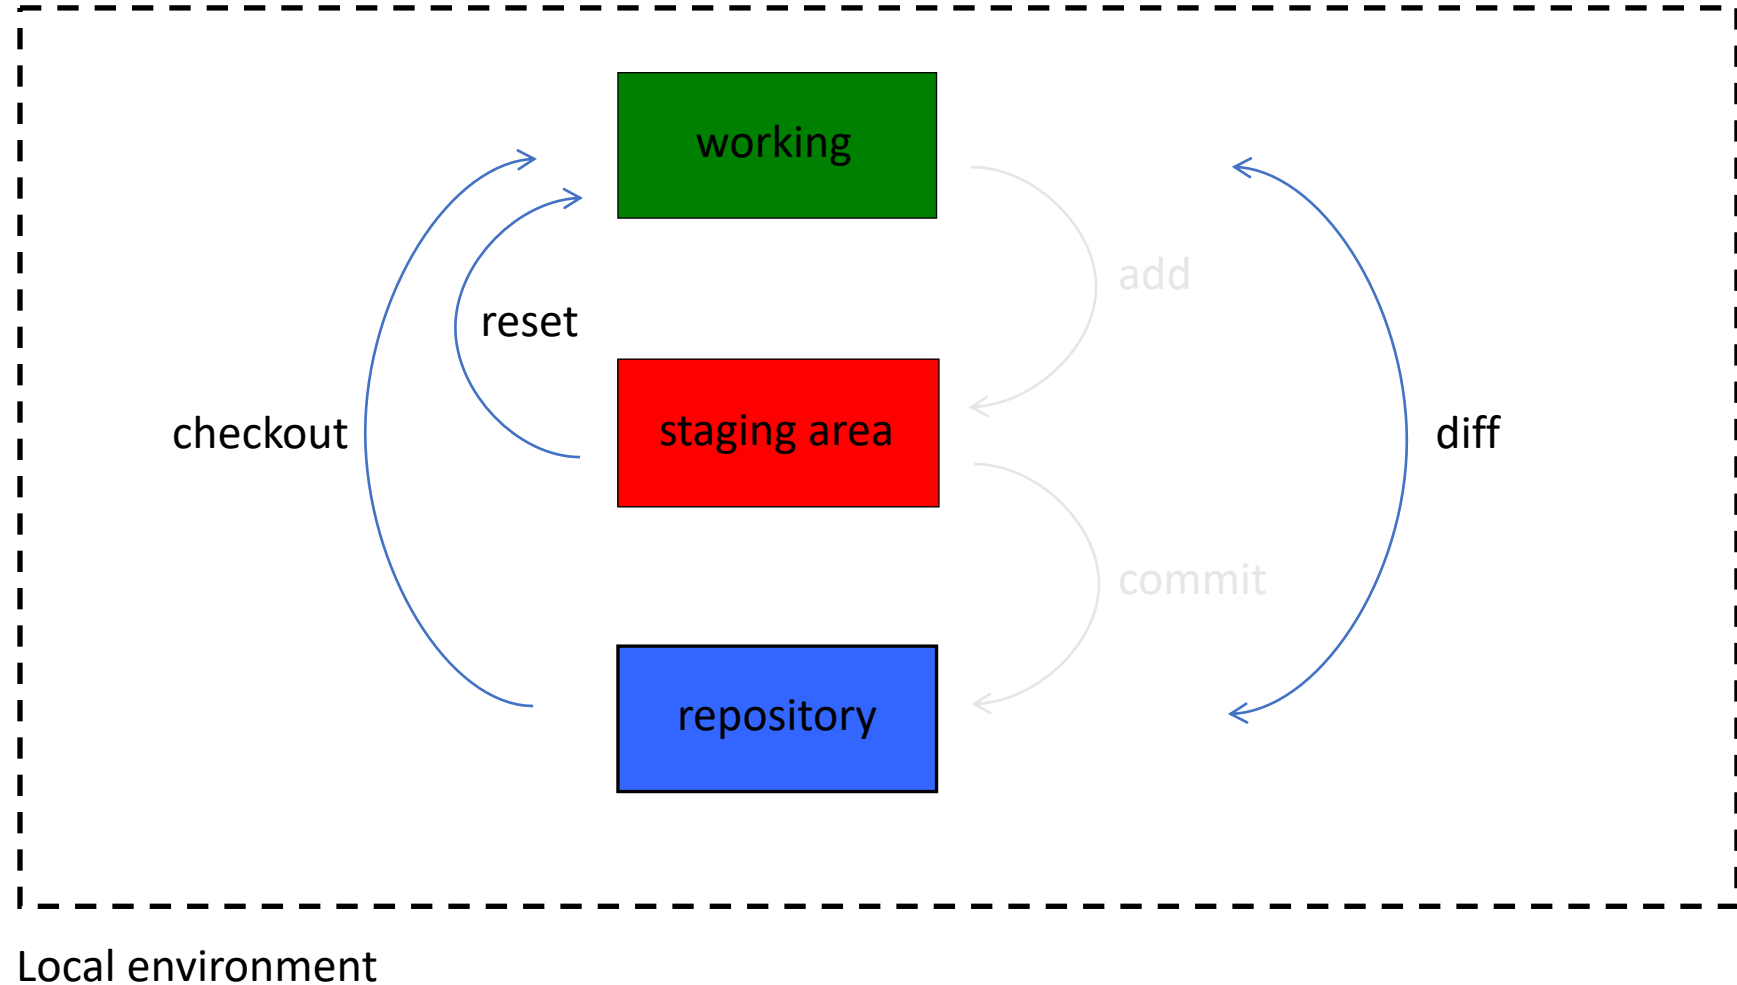

Development environment

Git Workflow

Git Workflow

Basic Git Commands

Create repositories

\$ git init [project-name]

Creates a new local repository with the specified name

\$ git clone [url]

Downloads a project and its entire version history

Make changes

\$ git status

Lists all new or modified files to be committed

\$ git add [file]

Snapshots the file in preparation for versioning

\$ git reset [file]

Unstages the file, but preserve its contents

\$ git diff

Shows file differences not yet staged

\$ git diff --staged

Shows file differences between staging and the last file version

\$ git commit -m "[descriptive message]"

Records file snapshots permanently in version history

Group changes

\$ git branch

Lists all local branches in the current repository

\$ git branch [branch-name]

Creates a new branch

\$ git checkout [branch-name]

Switches to the specified branch and updates the working directory

\$ git merge [branch]

Combines the specified branch's history into the current branch

\$ git branch -d [branch-name]

Deletes the specified branch

Review history

\$ git log

Lists version history for the current branch

\$ git log --follow [file]

Lists version history for a file, including renames

\$ git diff [first-branch]...[second-branch]

Shows content differences between two branches

\$ git show [commit]

Outputs metadata and content changes of the specified commit
